Executive Summary

At a time when America is facing an obesity epidemic, crushing debt and a weak economy, billions of taxpayer dollars are subsidizing junk food ingredients.

In this report, we find that in 2011, over \$1.28 billion in taxpayer subsidies went to junk food ingredients, bringing the total to a staggering \$18.2 billion since 1995. To put that figure in perspective, \$18.2 billion is enough to buy 2.9 billion Twinkies every year—21 for every single American taxpayer.

In contrast, only \$637 million has gone to subsidies for apples since 1995. That's enough to buy 77 million apples per year on average—but just half of one apple per taxpayer.

At the same time, childhood obesity rates have tripled over the last three decades, with one in five kids aged 6 to 11 now obese. These increases in obesity rates will translate into kids who are at greater risk for heart disease and diabetes, undermining the health of our country and driving up medical costs by hundreds of billions

of dollars. The rise in obesity has many causes, but one of the most important is the increased prevalence of high-fat, heavily sweetened junk food.

Between 1995 and 2011, American taxpayers spent over \$277 billion in agricultural subsidies. Most subsidies went to the country's largest farming operations, mainly to grow just a few commodity crops, including corn and soybeans.

Most of these commodity crops are not simply eaten as-is. Among other uses, food manufacturers process them into additives like high fructose corn syrup and vegetable oils that provide a cheap dose of sweetness and fat to a wide variety of junk food products. Thus, Americans' tax dollars directly subsidize junk food ingredients

Key Findings:

- Between 1995 and 2011, \$18.2 billion in tax dollars subsidized four common junk food additives—corn syrup, high fructose corn syrup, corn starch, and soy oils (which are processed further into hydrogenated vegetable oils).

- Healthier agricultural products receive very little in federal subsidies. Since 1995, taxpayers spent only \$637 million subsidizing apples, which is one of the few fresh fruits or vegetables that have a significant federal subsidy.
- If subsidies for junk food ingredients went directly to taxpayers to allow them to purchase food, each of America's 141 million taxpayers would receive \$7.58 to spend on junk food and 27 cents to spend on apples each year—enough to buy 21 Twinkies but just half of one Red Delicious apple.
- The \$18.2 billion in subsidies for junk food ingredients that taxpayers have shelled out since 1995 is enough to buy 49 billion Twinkies. Placed end to end, they would circle the globe 125 times.
- Since 1995, the lion's share of agricultural subsidies has gone to a very small number of large operations—75% of subsidies go to just 3.8% of U.S. farmers.

The fact that so many tax dollars are being wasted on junk food demonstrates the need to reform federal agricultural subsidies and end this wasteful spending.

Apples to Twinkies: Comparing Federal Subsidies for Fresh Produce and Junk Food

Introduction

The U.S. is in the middle of a public health crisis. We face a steep rise in obesity across the country, which is having an impact on our health, especially the health of our children.

Childhood obesity rates in the U.S. have more than tripled in the past 30 years.¹ Almost one in five children aged 6 to 11 is now obese. The consequences are significant. Obese children have arteries so thick that they resemble those of 45-year-olds, putting them at greatly increased risk of heart disease.² Seventy percent of obese 5- to 17-year-olds show one of the risk factors for heart disease.³

Dollars don't fully capture the scale of this crisis, but they can at least suggest its outlines: \$150 billion a year is spent on obesity and its related co-morbidities, a value that has doubled over the last decade.⁴ And it's going to get worse; without significant policy changes, projections suggest that by 2030, half of Americans will be obese, and

we will be spending an additional \$66 billion a year in medical costs as a result.⁵

The obesity epidemic has many causes, but one of the simplest is also among the most significant: junk food. There are many reasons behind the increased production and consumption of junk food, some simply due to consumer taste and technological innovation. But our own government policy is also responsible for promoting obesity-fueling empty calories. The fact is that even as nutritionists and researchers tell us to cut down on junk food in order to end the childhood obesity epidemic, federal agricultural policy is busily underwriting the problem.

Federal Agricultural Policy Has Lost Its Way

When significant federal support for American agriculture began in the 1930s, it was aimed at helping small family farms,

many of which were struggling as the economic catastrophe of the Great Depression and the environmental catastrophe of the Dust Bowl caught American farmers in a perfect storm.

Decades later, these programs have become ensconced as a permanent part of the policy landscape. And while they'd originated as rescue programs to help small, family-owned farmers keep their doors open, they've been reshaped into subsidies that primarily benefit the country's largest farming operations.

Since 1995, taxpayers have spent over \$277 billion on agricultural subsidies. Reflecting the political clout of the biggest producers, the lion's share of agricultural subsidies go to a very small number of large operations—75% of subsidies go to just 3.8% of U.S. farmers.⁶ Ironically, the large producers who are the disproportionate recipients of subsidies may then use the dollars they receive from the federal government to buy out the smaller farms around them, meaning that the subsidies can be actively harmful to small family farmers.⁷

There is a dizzying variety of subsidy programs—market loans, crop insurance, counter-cyclical payments. Most taxpayer dollars go to subsidizing a few commodity crops. Of the \$277 billion spent since 1995, a full \$81.7 billion went to subsidize corn; wheat and cotton growers received over \$32 billion apiece; soybeans were subsidized to the tune of \$26.3 billion. Other big-ticket items include rice, sorghum (a type of grass frequently used as livestock fodder), peanuts, barley, tobacco, and livestock and dairy production. Non-crop-specific disaster relief and conservation programs make up most of the remaining spending, with other sectors of the agricultural economy receiving little in subsidies.⁸

Commodity crops are not unhealthy in and of themselves. But most of the corn and soybeans we grow do not go to Americans' plates as-is. For example, only about 1% of U.S.-produced corn is the sweet corn that is usually directly eaten by humans.⁹ Instead, most commodity crops are fed to livestock, turned into biofuels, or processed into additives like high fructose corn syrup or hydrogenated vegetable oils.

In contrast, apples are one of the only fresh fruits or vegetables receiving significant federal subsidies. Since 1995 the entire complex of federal agricultural programs has spent only \$637 million on apples¹⁰, and even this modest support is an overstatement of the subsidies going to *fresh* apples—some of the apple crop is itself processed into forms like apple juice or applesauce which in turn may be sweetened with high fructose corn syrup.

Indeed, federal subsidies create very strong perverse incentives discouraging farmers from growing fresh fruits and vegetables: growers of corn or wheat who also use the land to raise produce can see their subsidies revoked and face further penalties.¹¹

Federal Subsidies for Junk Food Ingredients

Perhaps the greatest example of how U.S. farm policy has lost its way is the fact that many subsidized crops are processed into common junk food ingredients. A substantial portion of the corn grown in the U.S. is turned into high fructose corn syrup (HFCS) and corn starch, carbohydrates with no nutritional value. Soybeans are ground up, with the meal going to feed cows, and the liquid skimmed off

“The lion’s share of agricultural subsidies go to a very small number of large operations—75% of subsidies go to just 3.8% of U.S. farmers.”

Crop Insurance Costs Soar

The federal crop insurance program is one of the largest subsidy programs, and the fastest growing. The program allows farm companies to shift their business risk onto taxpayers. Crop insurance is very different from home or car insurance policies with which consumers are familiar. Instead of individuals or companies covering the full cost of their insurance protection, the crop insurance policies are subsidized by taxpayer dollars.

The program subsidizes 62% of crop insurance premiums, on average, and reimburses insurance companies for their administrative and operating expenses. These premiums are used to guarantee as much as 85% of revenue.¹² Additionally, crop insurance can be used to insure an expected level of revenue, meaning insurance payouts can kick in even after a bountiful harvest.

Costs for crop insurance programs rose to \$5.7 billion in 2009 as higher premiums from rising crop prices drove up premium subsidies to farmers.¹³ The costs for crop insurance programs were even higher in 2011 at over \$11 billion.¹⁴

The reason for this increase is counter-intuitive, and illustrates a key problem with how this program is designed. The program primarily benefits growers of commodity crops such as cotton, corn, wheat, and soybeans and these commodity crop prices have risen to historic levels in recent years. As a result, the cost to insure these crops has grown. As the insurance premiums go up, taxpayer premium subsidies go up.

In other words, when market forces create high crop prices which benefit farm operations, taxpayer subsidies to those operations *increase*. This is why rising subsidies are occurring at the same time that large agribusiness operations are experiencing record profits. Last year the agricultural sector made over \$98 billion in profit.¹⁵

Unlike other agricultural subsidy programs, the federal crop insurance program is not currently subject to any payment limitations or caps. Earlier this year, the GAO found that just 4% of the most profitable farm operations accounted for nearly 33% of all premium support provided by the federal government.¹⁶

and turned into fat-based additives like hydrogenated vegetable oil. When taxpayers subsidize these commodity crops, they subsidize junk food ingredients as well.

Take the Twinkie: of its 37 ingredients,

at least 14 of them are made with federal subsidies, including corn syrup, high fructose corn syrup, corn starch, and vegetable shortening.¹⁷ Twinkies are sweet, fatty and calorie-rich, but utterly lacking in nutritional value.

But the Twinkie hardly stands alone: high fructose corn syrup can be found in cookies, candies, cakes, soda, bread, ketchup, yogurt, salad dressing, and sauces.¹⁸ Vegetable oils and shortening derived from soy are also ubiquitous in processed food products.

To estimate how many taxpayer dollars are directly supporting junk food production, this report analyzes tax spending on four “empty calorie” ingredients that are almost pure sugar, fat, or carbohydrate, with very limited nutritional value: corn syrup, high fructose corn syrup, and corn starch, all derived from corn, and soybean oil.¹⁹

Subsidies for Corn Syrup, High Fructose Corn Syrup, and Corn Starch

High fructose corn syrup is a corn-derived sweetener that is used as a replacement for sugar in many foods, because it is cheaper. Biologically, it is almost indistinguishable from ordinary table sugar, containing roughly equal parts fructose and glucose.²⁰ Ordinary corn syrup, or dextrose, is a sweetener that is primarily glucose but with a much lower fructose content. Corn starch is, simply enough, made by processing corn to remove everything but the starch. It is a pure carbohydrate, used as a thickening agent in foods.

A substantial portion of the corn produced in the U.S. is processed into these additives. According to USDA, since 1995, the nation grew 192.3 billion bushels of corn. Of those, 13.9 billion bushels were processed into some form of corn sweetener, while a further 4.6 billion bushels were turned into corn starch.²¹ Thus, over this time period, approximately 9.64% of all American corn was turned into junk food ingredients.

Subsidy databases show that since 1995, \$81.7 billion in taxpayer dollars have

supported the growing of corn.²² Therefore, 9.64% of this total, or \$7.9 billion, has gone directly to corn-based sweeteners and corn starch.

Subsidies for Soy Oils

While corn commonly shows up in American supermarkets, in both processed and non-processed forms, soybeans have a much less ubiquitous presence on retail shelves. Yet they are a major recipient of federal agricultural subsidies, to the tune of \$26.4 billion since 1995.²³

When soybeans are processed, they are crushed, yielding both oils and ground soy meal. The meal is primarily used as animal feed, while the resulting oils are processed and sold directly as vegetable oil and used as additives in other foods. When a nutrition label lists “vegetable oil” or “vegetable shortening” as an ingredient, very often that vegetable is soy. In fact, soybean oil accounts for roughly two thirds of all edible oils eaten in the United States.²⁴

Soy oil, as a pure fat, is often added to processed foods to make them better-tasting. Vegetable oils and shortening show up in Twinkies, cakes, cookies, crackers, fish sticks, margarine, breakfast cereals, and many other snack foods.²⁵

Determining the percentage of the soybean crop that is processed into junk food ingredients is more complex than it is for corn, because the same soybeans are processed into both meal and oils. However, USDA data breaks down the value of the yearly soybean crop that is attributable just to soy oils, rather than the value of the meal or hulls. Since 1995, 39% of the value of the soybean crop has come from oils.²⁶

Taxpayers have spent \$26.4 billion subsidizing the production of soybeans since 1995. Thus, \$10.3 billion in taxpayer

dollars over that time period has gone to soy oils that are turned into hydrogenated vegetable oils and other junk food additives.

Between these four ingredients—corn syrup, high fructose corn syrup, corn starch, and soy oils—taxpayers have paid \$18.2 billion supporting junk food since 1995. To put that figure in perspective, \$18.2 billion is enough to buy 49 billion Twinkies.²⁷ Placed end to end, 49 billion Twinkies would circle the globe 125 times.²⁸

Using the methodology described above, we also determined the junk food subsidies for the last two years. Taxpayer subsidies for junk food ingredients grew from \$853 million in 2010 to \$1.28 billion in 2011.

Apples to Twinkies

The significant public expenditure on unhealthy additives is a counterproductive use of taxpayer dollars, and reflects our skewed agricultural policy priorities. The perversity of these subsidies can be clearly seen by examining how much federal support goes to what most nutritionists recognize as the healthiest category of foods: fresh fruits and vegetables.

Only one of the top twenty federal subsidy programs directly supports a fresh fruit or vegetable: apples.²⁹ It comes in at number 19 on the list: since 1995 the entire complex of federal agricultural programs has spent only \$637 million on apples, a fraction of the taxpayer dollars going to junk food.

Twinkies provide a perfect illustration of the junk food heavily subsidized by our food policy; the Red Delicious can serve

as a representative of the other varieties of apple.

In the seventeen years between 1995 and 2011, taxpayers spent \$18.2 billion subsidizing junk food ingredients; they spent \$637 million on subsidies for apples. On average, every year, that's \$1.07 billion for junk food, and \$37.4 million for apples.

These payments went to the farming companies that grew the crops, of course, but it's possible to illustrate our nation's priorities by seeing what our agricultural subsidies would buy.

If these agricultural subsidies went directly to taxpayers to allow them to purchase food, each of America's 141 million taxpayers would be given \$7.58 to spend on junk food and 27 cents to spend on apples each year—enough to buy 21 Twinkies but just over half of one Red Delicious apple.

Conclusion

Billions of dollars in subsidies have been spent over the past decades to support junk food ingredients. This distressing practice doesn't reflect an overall policy of massive support for the entire agricultural sector; instead, it's the result of a conscious policy that directs subsidies to commodity crops that are more likely to be processed into food additives.

USDA says fruits and vegetables should make up about half of the foods on our plates, yet as this reports documents, this priority is not reflected in the way taxpayer dollars are spent through agricultural subsidies.

This wasteful spending not only squanders taxpayer dollars: by fueling the crisis

of childhood obesity, the subsidies damage our country's health and increase the medical costs that will ultimately need to be paid to treat the effects of the obesity epidemic. Taxpayers are paying for the privilege of making our country sick.

Subsidies to large agribusinesses are egregious enough on their own; the fact that the subsidies go to junk food adds insult to injury.

At a time when government spending is coming under increased scrutiny, policy-makers should take a hard look at what our agricultural policy says about our priorities. This is a golden opportunity to ensure our agricultural policy is aligned with our food policy, and take a stand against subsidies for junk food.

Table 1: Apples and Twinkies Purchasable with Federal Subsidies, by Major U.S. City

City	State	Population	Share of Junk Food Subsidies	Number of Twinkies	Share of Apple Subsidies	Number of Apples
Albuquerque	New Mexico	552,804	\$1,899,583	5,140,956	\$66,491	137,024

Endnotes

1 Obesity is defined by having a Body Mass Index of over thirty (BMI is calculated by dividing weight, in kilograms, by the square of height, in meters). A male at the average American height of 5'10" is obese if he weighs more than 210 pounds; for a woman at the average American height of 5'4", obesity sets in at weights above 175 pounds. See the World Health Organization, Information Sheet on Obesity and Overweight, at <http://www.who.int/dietphysicalactivity/publications/facts/obesity/en/>; Wikipedia, *Human Height*, at http://en.wikipedia.org/wiki/Human_height#Average_height_around_the_world.

6 Environmental Working Group, 2012 Farm Subsidy Database, at <http://farm.ewg.org>. Ten percent of subsidy recipients collected 75% of the subsidies, but because USDA reports that 62% of American farmers don't pocket a dollar in federal

subsidies, only 3.8% of farmers are being paid three quarters of the total subsidies.

16 2012 Farm Subsidy Database.

17 The full list includes wheat flour, corn syrup, HFCS, vegetable shortening, animal shortening, eggs, dextrose, “modified cornstarch,” corn flour, soy protein isolate, soy flour, corn dextrin, soy lecithin, cornstarch. Laura Coffey, *37 Ingredients Twinkie Eaters Ingest*, MSNBC, at <http://today.msnbc.msn.com/id/38872091/ns/today-food/t/ingredients-twinkie-eaters-ingest/>.

18 See a representative list at e.g. Kate Hopkins, *Foods and Products Containing High Fructose Corn Syrup*, Accidental Hedonist, at http://www.accidentalthedonist.com/index.php/2005/06/09/foods_and_products_containing_high_fruct.

19 This conservative definition underestimates federal support for junk food. Wheat flour, which may be processed and “enriched”, is used in a large number of such products. Similarly, dairy subsidies support the production of milk, eggs, and cheese, which may be used as junk food ingredients. Even for the crops we do examine, we do not fully capture how much is going to junk food—corn chips and corn puffs, for example, include more corn-based ingredients than just processed corn starch and sweeteners.

20 Gary Taubes, *Is Sugar Toxic?*, N.Y. Times Magazine, Apr. 17, 2011, at <http://www.nytimes.com/2011/04/17/magazine/mag-17Sugar-t.html?pagewanted=all>. However, some studies have suggested that consuming high fructose corn syrup rather than sugar may lead to increased weight gain. See, e.g., Hilary Parker, *A Sweet Problem: Princeton Researchers Find that High Fructose Corn Syrup Prompts Considerably More Weight Gain*, princeton.edu, Mar. 22, 2010, at <http://www.princeton.edu/main/news/archive/S26/91/22K07/>.

21 USDA Economic Research Service, Sugar and Sweeteners: Recommended Data, Table 27: U.S. Use of Field Corn, by Crop Year. Because this data set is arranged in “crop years” stretching from September of one year through August of the next, we started our count in the 1995/96 crop year. Available at

<http://www.ers.usda.gov/data-products/sugar-and-sweeteners-yearbook-tables.aspx>.

22 2012 Farm Subsidy Database.

24 Kayla Hedrick, “Low-Lin” Oil Helps Keep Us Healthier and Profitable, unitedsoybean.org, Jan. 19, 2011, at <http://unitedsoybean.org/topics/consumer/low-lin-soybean-oil-helps-keep-us-healthy-and-farmers-profitable>.

25 Many soy oils undergo a process called hydrogenation before being used in food products. Hydrogenation is a process that can help protect oils from spoilage and improve their taste, as well as making them semisolid. However, partial hydrogenation also increases the concentration of trans fatty acids in the oil, and consumption of trans fats has been shown to increase the risk of heart disease. Due to these health concerns, food processors have been decreasingly relying on partial hydrogenation of soy oils. *Id.*; Wikipedia, *Hydrogenation*, at <http://en.wikipedia.org/wiki/Hydrogenation>.

26 USDA Economic Research Service, Oil Crops Yearbook 2011, Table 9: Soybeans: Monthly Value of Products Per Bushel of Soybeans Processed, and Spot Price Spread, U.S., 1990/91 -2010/11. The average share of the price since 1995 is weighted by the total soybean production in a given year, which may be found in Table 2: Soybeans: Acreage Planted, Harvested, Yield, Production, Value, and Loan Rate, U.S., 1960-2012. Available at usda.gov/data-products/oil-crops-yearbook.aspx

27 If bought in larger quantities, the per-unit cost of a Twinkie is roughly \$.37. See, e.g., this Amazon.com product listing: <http://www.amazon.com/Hostess-Twinkies-individually-wrapped-twinkies/dp/B0027AR7RU>.

28 A Twinkie is 4” long. See <http://science.howstuffworks.com/innovation/edible-innovations/twinkie.htm>. Earth’s circumference is 24,901 miles. See <http://en.wikipedia.org/wiki/Earth>.

29 2012 Farm Subsidy Database. Federal farm policy does include disaster relief payments that go to owners of orchards and other fruit-growing trees in the event that a natural disaster damages their crop; due to the non-recurrent, random nature of these payments, we do not include them in our analysis. Number twenty on the list are subsidies for growing sugar beets, a tuber; however, sugar beets are cultivated to be processed into sugar, not to be eaten directly.
