

Cooler Together

The Benefits of Cooperative Action Against Global Warming in the Northeast, Mid-Atlantic and Beyond

In 2008, a bipartisan group of governors in the Northeast and Mid-Atlantic states launched the Regional Greenhouse Gas Initiative (RGGI), the nation's first regional program to limit the pollution that causes global warming. A decade later, the initiative is a proven success—cutting pollution and moving the region toward a clean energy future—and an example for other states to follow.

HOW THE PROGRAM WORKS

IMPRESSIVE BENEFITS

The benefits of RGGI to the region include:

- Helping to **cut carbon pollution in half** from power plants since 2005.¹
- Raising more than \$2.7 billion for member states, including more than **\$1 billion for energy efficiency** improvements and \$270 million for clean and renewable energy.²
- **Averting hundreds of premature deaths** through cleaner air.³

ROOM TO GROW

To build on the success of RGGI:

- Other states—including New Jersey and Virginia—can join the program or adopt parallel programs.
- Northeast and Mid-Atlantic states can expand RGGI's proven approach to cover other sources of carbon pollution besides power plants, such as transportation.
