Counsel for Amici Curiae

IDENTITY AND INTEREST OF *AMICI CURIAE*

Amici Curiae are 62 elected local or state officials, each with a role in ensuring the health and safety of their residents (hereinafter “*Amici*”). A list of *Amici* is attached as an Addendum hereto. *Amici* have a strong interest in protecting the quality of their municipalities’ water supplies and in protecting the quality of nearby watersheds. *Amici* seek to provide information regarding the beneficial impact that Agencies’ definition of “waters of the United States” in the Clean Water Rule, 80 Fed. Reg. 37,054 (June 29, 2015) (“the Rule”), will have on their ability to promote health, welfare, and financial prosperity in their communities. They respectfully ask this Court to reach the merits of the case and to uphold the Rule.

The interests of *Amici* are further set forth in the accompanying Motion for Leave to File, and the specific interests of several of the *Amici* are set forth in detail in Section I of this brief.

ARGUMENT

I. LOCAL ELECTED OFFICIALS ARE STRONGLY IN FAVOR OF THE RULE AND ITS PROTECTIONS.

All 62 local government *Amici* strongly support the Clean Water Rule and believe that its protection of intermittent and ephemeral waterways is important to

their communities. The following examples, drawn from the experiences of some of the *Amici*, are representative of this support of, and interest in, the Rule.

Chelsa Wagner is the Controller of Allegheny County, Pennsylvania. In this role, she is responsible for holding the government of Allegheny County accountable to its taxpayers. She monitors the Allegheny County Health Department, which is responsible for ensuring that 36 water-provider agencies in the county deliver safe drinking water to county residents. Ms. Wagner supports the Clean Water Rule because the protection of upstream tributaries and wetlands, both large and small, is essential to keeping pollutants out of the Allegheny River watershed. High levels of lead in the drinking water is a serious concern, in part because pollution within the watershed of the Allegheny River causes acid corrosion to the lead service lines that serve up to twenty percent of Pittsburgh homes.

For decades, the largest of the county's municipal water providers, the Pittsburgh Water and Sewer Authority ("PWSA"), has been forced to add soda ash to the water at significant expense to ratepayers just to keep the city's water safe to drink. When budgetary concerns instigated a shift to a cheaper substitute, lead levels spiked in Pittsburgh, endangering the health of the city's children. Troubling as this is, the PWSA is the most well-resourced and closely-overseen of any municipal water department in the county; smaller water providers struggle

even more with these costs. The residents of Allegheny County depend on the protections of the Clean Water Act to prevent ratepayer dollars from being spent on treatment of pollution from upstream tributaries and wetlands. Water contamination has also undermined trust in the county's water providers and forces consumers to purchase water filters and bottled water. Purchases such as these add to the financial hardship of the twenty-two percent of Pittsburgh residents living below the poverty line.

In addition, Allegheny County is a flood-prone area due to its deep valleys surrounded by many miles of rivers and streams, and the Clean Water Rule is important for the protection of wetlands and ephemeral streams that absorb dangerous and damaging flood waters. For example, the small borough of Millvale, with an aging infrastructure and limited municipal resources, floods frequently due to increased development in the North Hills in the watershed of Girty's Run. These floods disrupt life in the community, damage property, halt commerce, and cost residents and businesses money.

In summary, Ms. Wagner's experience has taught her that when we fail to extend Clean Water Act protections to Allegheny County's wetlands and small waterways, we risk the health and welfare of the citizens and place a heavy burden on municipalities and their taxpayers to mitigate the damage downstream.

Erik Curren is a member of the City Council of Staunton, Virginia. As residents of a small city located in a major agricultural area, his constituents rely on streams as water sources and wetlands for wildlife habitat. These resources help keep the surrounding ecosystem healthy. This helps the local farmers, anglers, and hunters who rely directly on a healthy environment, as well as all who eat local food and drink local water. As Mr. Curren notes, “Staunton especially relies on water sources located in rural areas outside our city limits, and those sources have provided our citizens with safe, clean water for more than 250 years, ever since our city was founded in 1748.”

Andrew Johnson is a member of the City Council of Minneapolis, Minnesota. Drinking water for the more than 400,000 residents of his city comes from the Mississippi River and its many tributaries. Minneapolis is also home to numerous lakes within its borders, 13 of which are at least five acres in size. These lakes are of immense economic value for the city, as they are hubs for recreation and tourism. The Clean Water Rule’s inclusion of ephemeral and intermittent streams and related wetlands is an important protection for the city’s waters; they are critical to the health of the entire watershed network that feeds and cleans its lakes the many tributaries to the Mississippi River.

Chip Smith, a member of the City Council of Ann Arbor, Michigan, is worried that the relaxation of the Clean Water Rule will remove protections from

the smaller waterways that help keep his city's waters clean. The Huron River is the heart of his community. The Clean Water Rule protects the vital creeks, streams, tributaries, and wetlands that are critical to the health of the entire Huron River System. Relaxing the Rule, Mr. Smith believes, will make it substantially more difficult to make positive steps to improve the health of that river system.

Samuel Henderson is the mayor of Gulfport, Florida, located in Pasadena County on Florida's gulf coast. His city is in the most densely populated county in the State of Florida, and all its water resources – from the Gulf of Mexico to the smallest streams and wetlands – are important to the health and livelihood of his constituents. They are all also subject to urban environmental impacts.

Accordingly, it is important to Mr. Henderson that the Clean Water Rule be implemented and enforced, and not weakened or withdrawn.

II. THE RULE IS WELL WITHIN THE SCOPE OF *RAPANOS* AND ITS PREDECESSORS.

A. The Rule May Properly Draw From Both the *Rapanos* Plurality and Justice Kennedy's Concurrence.

In *U.S. v. Cundiff*, 555 F.3d 200, 209 (2009), the Sixth Circuit Court of Appeals left open the issue of how best to address the lack of a majority opinion in *Rapanos v. U.S.*, 547 U.S. 715 (2006). As that court noted in *Cundiff*, the guidance given by the Supreme Court in *Marks v. U.S.*, 430 U.S. 188 (1977), is inapposite to *Rapanos*, because neither the plurality opinion nor Justice Kennedy's opinion

concurring in the judgment is a subset of the other. *See* 555 F.3d at 209 (“when one opinion supporting the judgment does not fit entirely within a broader circle drawn by the others, *Marks* is problematic”) (citation and internal quotations omitted). *Amici* believe that the appropriate approach, as discussed in *U.S. v. Johnson*, 467 F.3d 56, 62-66 (1st Cir. 2006), a case whose reasoning the Sixth Circuit described as “thoughtful” in *Cundiff*, 555 F.3d at 208, is to find waters to be “waters of the United States” if they meet either the plurality’s test or Justice Kennedy’s test. This approach has the advantage, as noted by Justice Stevens in his *Rapanos* dissent, of ensuring that a majority of the *Rapanos* Court would hold that the waters in question are within the jurisdictional reach of the CWA. *Rapanos*, 547 U.S. at 810 n.14 (Stevens, J., dissenting).¹ It also, as a practical matter, moves only a very short distance from the principles underlying *Marks*; as noted by the Seventh Circuit, it will only be the “rare case” in which waters meeting the plurality’s test will not also meet Justice Kennedy’s test. *United States v. Gerke Excavating, Inc.*, 464 F.3d 723, 725 (7th Cir. 2006). *See also Rapanos*, 547 U.S. at 810, n.14 (Stevens, J., dissenting) (deeming it “unlikely” that “the plurality’s test is met but Justice Kennedy’s is not”).

¹ “Given that all four Justices who have joined this [dissenting] opinion would uphold the Corps’ jurisdiction in both of these cases—and in all other cases in which either the plurality’s or Justice Kennedy’s test is satisfied—on remand each of the judgments should be reinstated if *either* of those tests is met.”

B. All Portions of the Rule Are Consistent With Supreme Court Precedent.

In accordance with this approach, the Rule’s definition of “waters of the United States” can be usefully divided into two parts. The following categories from the Rule are waters of the United States under the plurality opinion (and in all likelihood under Justice Kennedy’s opinion as well)²:

“(1) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

(2) All interstate waters, including interstate wetlands;

(3) The territorial seas;

(4) All impoundments of waters” identified in paragraphs (1) through (3);

“(5) All tributaries... of waters identified in paragraphs [(1) through (3),” so long as those tributaries are relatively permanent; and

“(6) All waters adjacent to a water identified in paragraphs [(1) through (5)..., including wetlands, ponds, lakes, oxbows, impoundments, and similar waters,” so long as “adjacent” means “bordering” or “contiguous.”

It can generally be said that there is very little debate as to whether these six

² All quotations are from the Final Rule, 80 Fed. Reg. 37,054 (June 29, 2015); 33 CFR § 328.3(a) (and, in the case of (6), 33 CFR § 328.3(c)(1)). Note that the last seven category numbers used here – (4) through (10) – do not correspond fully to those in the Rule (which lists only eight categories in total). The categories used here have been rearranged in certain cases to allow a more clear-cut division between the non-controversial and controversial designation of jurisdictional waters.

categories of waters come within the jurisdictional scope of the Clean Water Act (“CWA” or “Act”). There is no dispute that the Act covers traditionally navigable or interstate waters, including the territorial seas (categories 1 through 3); *Rapanos* and *United States v. Riverside Bayview Homes, Inc.*, 474 U.S. 121 (1985), both make clear that the scope of the Act extends beyond such waters; *Riverside Bayview* holds (and the *Rapanos* plurality confirms) that the Act extends to wetlands and other non-navigable waters that abut such waters (category 6); and the *Rapanos* plurality affirms that “relatively permanent, standing or flowing” tributaries of such waters (categories 4 and 5) are also within the scope of the Act, 547 U.S. at 732.

It is the following four categories – all of which are consistent with Justice Kennedy’s concurrence – which have been the primary focus of arguments that the Rule is too expansive³:

(7) Intermittent and ephemeral tributaries of waters identified in paragraphs (1) through (3), so long as they are “characterized by the presence of the physical indicators of a bed and banks and an ordinary high water mark;”

(8) Waters: within 100 feet of the ordinary high water mark of a water identified in paragraphs (1) through (7); within the 100-year floodplain of a water identified in paragraphs (1) through (7) and not more than 1,500 feet from the ordinary high water mark of such water; or within 1,500 feet of the high tide line of a water identified in paragraphs (1) or (3), or within 1,500 feet of the ordinary high water mark of the Great Lakes;

³ All quotations are from the Rule, 33 CFR §§ 328.3(a) & 328.3(c).

(9) “Prairie potholes,” “Carolina bays and Delmarva bays,” “Pocosins,” “Western vernal pools,” “Texas coastal prairie wetlands,” waters located within the 100-year floodplain of a water identified in paragraphs (1) through (3), and waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (1) through (7) that are determined, on a case-specific basis, to have a “significant nexus” to a water identified in paragraphs (1) through (3); and

(10) Impoundments of the waters identified in (7) through (9).

Justice Kennedy’s concurrence draws from the straightforward proposition, articulated in *Solid Waste Agency of Northern Cook Cnty. v. U.S. Army Corps of Eng’rs*, 531 U.S. 159, 167 (2001) (“SWANCC”), that a waterway does not come within the jurisdiction of the Clean Water Act unless it has a “significant nexus” to core waterways (traditional navigable or interstate waters or the terrestrial seas). This is not a vague concept; the primary purpose of the CWA is “to restore and maintain the chemical, physical, and biological integrity of the nation’s waters,” 33 U.S.C. § 1251(a), and the “significant nexus” test ensures that the Act’s jurisdictional reach extends no further than core waterways (traditional navigable and interstate waters and the territorial seas) and those that have a material impact on the chemical, physical, or biological integrity of such waterways. *See Rapanos*, 547 at 779 (“The required nexus must be assessed in terms of the statute’s goals and purposes.”) (Kennedy, J., concurring). Each of the four referenced categories comes within this “significant nexus” guideline.

The first two represent carefully-defined situations in which the Agencies' scientific analysis indicates that the requisite significant nexus is highly likely to exist. Such category-wide determinations are fully consistent with Chief Justice Roberts' suggestion in *Rapanos* that a comprehensive regulation defining the outer bounds of CWA jurisdiction would be "afforded generous leeway by the courts." 547 U.S. at 758. They are also consistent with Justice Kennedy's invitation to the Agencies to

identify categories of tributaries that, due to their volume of flow (either annually or on average), their proximity to navigable waters, or other relevant considerations, are significant enough that wetlands adjacent to them are likely, in the majority of cases, to perform important functions for an aquatic system incorporating navigable waters.

Id. at 781.

"Intermittent and ephemeral tributaries" of core waters (category 7) simply extends the "relatively permanent" tributaries endorsed by the *Rapanos* plurality to less permanent tributaries that possess certain physical indicators ("a bed and banks and an ordinary high water mark") that the Agencies have determined are concrete evidence that "there is volume, frequency, and duration of flow" in an amount "sufficient...to qualify as a tributary." 33 C.F.R. § 328.3(c); *see also* 80 Fed. Reg. 37,057 ("The Science Report and the [Science Advisory Board] review...confirmed that [t]ributary streams, including perennial, intermittent, and

ephemeral streams, are chemically, physically, and biologically connected to downstream waters, and influence the integrity of downstream waters.”).

Similarly, designation of the waters within category 8 – all of which are characterized by physical proximity to covered waters and thus come within the Rule’s definition of “neighboring” waters, 33 C.F.R. § 328.3(c)(2) – is based on the Agencies’ finding that “[t]he science is clear that a water’s proximity to downstream waters influences its impact on those waters,” and on the Science Report’s conclusion that “[s]patial proximity is one important determinant of the magnitude, frequency and duration of connections between wetlands and streams that will ultimately influence the fluxes of water, materials and biota between wetlands and downstream waters.” 80 Fed. Reg. at 37,089. The Agencies found “clear evidence waters within 1,500 feet of [traditionally navigable or interstate] waters, even when located outside the floodplain, perform critical processes and functions” for those waters. *Id.* at 37,086. The 1,500-foot threshold, the Agencies found, encompasses the waters that “most clearly significantly affect[] the integrity of the traditional navigable water or the territorial seas,” *Id.*

Category 9 draws directly from Justice Kennedy’s call for a case-by-case approach to significant nexus. The Agencies have identified (a) five specific, well-known aquatic features and (b) other waters within certain specified proximity measurements, and have allowed for case-by-case determinations as to whether

those waters have a “significant nexus” to traditional navigable or interstate waters or the territorial seas. If so, they are covered waters; if not, they are not. And, in an effort to ensure predictability and scientific rigor in these case-by-case determinations, the Agencies have provided a detailed definition of “significant nexus” that both explains the context within which these determinations are to be made and identifies nine specific aquatic functions on which a waterway’s “nexus” to traditional navigable or interstate waters or the territorial seas is to be evaluated. *See* 33 C.F.R. § 328.3(c)(5) (including (i) – (ix)).

Finally, category 10 simply makes the common sense clarification that the waterways within categories 7 through 9 do not lose their status as jurisdictional waters if they are impounded. Thus, for example, if an intermittent tributary of a traditional navigable water is dammed, the impoundment behind the dam will remain a covered water.

III. THE RULE’S NUMERIC DISTANCE LIMITATIONS ARE REASONABLE.

A. The Rule’s Distance Limitations are Due Substantial Deference Because They Stem From Agency “Line-Drawing” on a Technical and Elusive Subject.

Courts grant substantial deference to an agency’s bright-line rules and are “unwilling to review line-drawing performed by the [agency] unless a petitioner can demonstrate that lines drawn ... are patently unreasonable, having no relationship to the underlying regulatory problem.” *All. for Cmty. Media v. FCC*,

529 F.3d 763, 780 (6th Cir. 2008) (internal quotations omitted). An agency need not “identify the optimal threshold with pinpoint precision.” *Worldcom, Inc. v. FCC*, 238 F.3d 449, 461-62 (D.C. Cir. 2001). *See also Emily’s List v. FEC*, 581 F.3d 21-22 n.20 (D.C. Cir. 2009) (holding that agencies may lawfully “employ bright-line rules for reasons of administrative convenience, so long as those rules fall within a zone of reasonableness and are reasonably explained”); *Stereo Broad., Inc. v. FCC*, 652 F.2d 1026, 1031 (D.C. Cir. 1981) (“Where the [agency] is engaged in the process of drawing lines, of making judgmental decisions . . . it is our duty to accord respect to the [agency’s] expertise”). Here, the Agencies reasonably explained the distance limitations in the Rule’s preamble and a 423-page technical support document, which was based on a comprehensive science report that reviewed more than 1,200 peer-reviewed publications. *See* EPA, U.S. Army Corps of Eng’rs, *Technical Support Document for the Clean Water Rule: Definition of Waters of the United States* (May 27, 2015) (“*TSD*”); EPA Office of Reg’l Dev., *Connectivity of Streams and Wetlands to Downstream Waters: A Review of the Scientific Evidence* (Jan. 2015) (“*Science Report*”).

Additionally, where an agency establishes bright-line rules with respect to “‘elusive’ and ‘not easily defined areas,’” like the Rule’s determination of the distance between two waters at which the waters are no longer “adjacent,” the courts’ “review is considerably more deferential, according broad leeway to the

[agency's] line-drawing determinations.” *Sinclair Broad. Grp., Inc. v. FCC*, 284 F.3d 148, 159 (D.C. Cir. 2002) (internal quotations omitted) (granting heightened deference to the FCC’s line-drawing as a means to achieve diversity in broadcast programming). Moreover, courts have granted EPA “an extreme degree of deference” when its line-drawing determinations require “[evaluation of] scientific data within its technical expertise.” *Nuclear Energy Inst., Inc. v. EPA*, 373 F.3d 1251, 1276 (D.C. Cir. 2004) (internal quotations omitted). The Agencies’ explanations of their scientific reasoning in selecting the bright-line distance limitations in the Rule satisfy these deferential standards.

B. The Rule’s Distance Limitations are Lawful Because They are Rationally Related to the Science of Connectivity Between Waters.

The Rule’s numeric distance limitations are reasonable because connectivity between waters decreases as distance increases. There is ample evidentiary support in the record establishing the strong relationship between distance and connectivity of two waters. *See, e.g., Science Report* at 2-38 (as distance between two waters increases, intervening streams may absorb or transform material being transported downstream, resulting in material transported over long distances either not reaching downstream rivers or reaching the river in a different form); 3-34 (finding that bed sediment material concentrations in a river were inversely related to downstream distance); 3-39 (invertebrate richness in downstream waters

is inversely related to distance from perennial streams); 3-43 (genetic connectivity, connecting populations by gene flow and reducing the incidence of inbreeding, “decreases with increasing spatial distance”); 4-31 (inferring from the similarity of plant communities in closer together waters that there is “biological connectivity between proximal lakes and wetlands”).

Evidence of this type has been held sufficient to survive arbitrariness review. For example, the Federal Energy Regulatory Commission (“FERC”) is tasked with determining whether an energy source is an “economically practicable” alternative to natural gas. *Process Gas Consumers Grp. v. Fed. Energy Regulatory Comm’n.*, 712 F.2d 483, 484 (D.C. Cir. 1983). An energy source is less economically practicable as it becomes more expensive relative to natural gas. *See, e.g., id.* at 487-88. FERC determined that middle distillate fuel oil—which was 2.5 times as expensive as natural gas—was not an economically practicable alternative to natural gas, but that low sulfur fuel—which was twice as expensive as natural gas—*was* economically practicable. *Id.* at 484, 487-88. The District of Columbia Circuit upheld FERC’s decision because of its general reasonableness, because of FERC’s high level of technical expertise compared to the court, and because “the line had to be drawn somewhere.” *Id.* at 488.

Additionally, just as it is impossible to specify with scientific precision exactly what oil price is economically impracticable, it is impossible to specify

with precision the distance at which upstream waters should no longer be considered adjacent to downstream waters. *See* 80 Fed. Reg. at 37,057 (noting that, because “waters fall along a gradient of chemical, physical, and biological connection to traditional navigable waters,” establishing distance limitations requires “scientific and policy judgment, as well as legal interpretation”); *TSD* at 298 (“While these distance effects occur as a continuous function, it is a common scientific practice to use such variables to define discrete bins, which can then serve as a basis for a boundary”). The Agencies’ decision to set the Rule’s distance thresholds based on these principles thus was rationally related to the identification of waters that are sufficiently connected to navigable waters as to be considered adjacent.

Moreover, beyond the general relationship between connectivity and distance, the Agencies have presented substantial evidence supporting the Rule’s specific numeric limitations establishing the reasonableness of these limitations. Support for drawing a line at “waters within 100 feet” of a traditionally navigable water can be found at, *e.g.*, *TSD* at 295-96 (waters within 100 feet of the ordinary high water mark of a jurisdictional water are located in a position relative to that water that permits the upstream water to function as a sink, retaining and breaking down pollutants, sediments, and nutrients “that could otherwise negatively impact the condition or function of downstream waters”); 298 (most “water quality and

habitat benefits will generally occur within a several hundred foot zone of a water;” creatures that use aquatic habitats “will use at least a 100-foot zone for foraging, breeding, nesting, and other life cycle needs”).

The 1,500-foot distance limitation for waters within the 100-year floodplain is based on the Agencies’ reasonable determination that these waters “lie within landscape settings that have bidirectional hydrological exchange with” jurisdictional waters. *TSD* at 300. And the limitation for waters within 1,500 feet of a high tide line or the ordinary high water mark is based on the following reasoning:

Waters more closely located to [jurisdictional waters] are also more likely to be biologically connected to such waters more frequently and by more species, including amphibians and other aquatic animals. To protect tidal traditional navigable waters, the territorial seas, and the Great Lakes, the 1,500-foot threshold is a reasonable distance to capture most wetlands and open waters that are so closely linked to the [jurisdictional waters] that they can properly be considered adjacent as neighboring waters.

Id. at 304.

This evidence supporting the Rule’s numeric distance limitations is distinguishable from the scant evidentiary basis supporting bright-line rules that courts have invalidated in the past. In *Cincinnati Bell Telephone Co.*, for example, the FCC had adopted a rule prohibiting an entity with a twenty-percent ownership interest in a cellular licensee from acquiring a “Personal Communications License.” The rule was an effort to “prevent” such entities “from exerting undue

market power” through control of the cellular licensee. *Cincinnati Bell Tel. Co. v. FCC*, 69 F.3d 752, 758 (6th Cir. 1995). The Sixth Circuit found the twenty-percent rule arbitrary and capricious because the percentage cut-off did not accurately gauge an entity’s ability to influence a cellular licensee. *Id.* at 759.

In contrast, the science supporting the Clean Water Rule’s distance limitations establishes that the vast majority of the waters within these limitations will have a significant nexus to traditionally navigable waters. Also, while the twenty-percent licensee share rule permitted or prohibited license acquisition solely based on percentage of ownership, the Rule allows for case-specific significant nexus determinations for waters beyond the distances used to determine adjacent waters. 80 Fed. Reg. at 37,059.

The court also criticized the FCC for failing to provide any evidence for the twenty-percent rule beyond “common sense” and the Financial Accounting Standard Board’s statement that twenty-percent ownership establishes a rebuttable presumption of corporate control. *Cincinnati Bell*, 69 F.3d at 759-60. In contrast, the Agencies’ evidence in support of their distance limitations is robust. The Agencies relied exclusively on peer-reviewed studies to generative evidence for the relationship between distance and connectivity and for the wisdom of the particular numeric distance limitations that the Agencies selected. *Science Report* at 1-17. Because the reasonableness of the Rule’s distance limitations is supported

by robust, credible science, *Cincinnati Bell's* criticism of bright-line rules is inapposite here.

Finally, it was lawful for the Agencies to decline to exercise case-by-case jurisdiction over waters lying more than 4,000 feet from traditionally navigable waters. *See* Fed. Reg. 80 at 37,071. The Agencies determined that the value of bright lines, which provide the Rule with additional “clarity, predictability, and consistency,” outweighed the value of including case-by-case analysis of the slim minority of waters that have a significant nexus with navigable waters over 4,000 feet away. *Id.* at 37090-91. Courts have found such accommodations in bright-line rules to be lawful. *See Cavert Acquisition Co. v. NLRB*, 83 F.3d 598, 606 (3d Cir. 1996) (upholding NLRB’s bright-line rule because it was appropriate for NLRB “to balance the need to make accurate determinations as to whether employees share a ‘community of interest’ against the necessity to make such determinations quickly and definitively.”); *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 531, 536-37 (D.C. Cir. 1983) (internal quotations omitted) (holding that, even though scientific evidence supported “banning lead from gasoline entirely,” EPA’s 1.10 grams per leaded gallon standard was permissible as an “accommodation” between health benefits and economic efficiency).

C. The Rule’s Distance Limitations Treat Similar Entities Alike, and it is Lawful for Bright-line Rules to Treat *Roughly Similar* Entities Falling on Either Side of the Line Differently.

The fact that the Rule’s distance limitations could theoretically result in differing regulation of similar waters on either side of the distance limitation does not render the thresholds unlawful. See *United States v. Haggard Apparel Co.*, 526 U.S. 380, 397 (1999) (holding that, when an agency must engage in line-drawing, “there will always be cases on opposite sides of the line that are almost identical,” but “[t]hat consequence . . . does not necessarily compromise the integrity of the line that the agency has drawn.”); *Louisiana ex rel. Guste v. M/V TESTBANK*, 752 F.2d 1019, 1029 (5th Cir. 1985) (holding that “such differing results are the inevitable result” of a bright-line rule and “indeed, decisions are the desired product”). These cases indicate that courts uphold bright-line rules despite disparate treatment of somewhat similar entities so long as the bright-line rule (here, the Rule’s distance limitations) rationally relates to the rule’s regulatory goals.

Moreover, the consequences of such disparate treatment in application of the Rule’s distance limitations will be especially minimal, because the distance limitations are designed to be *under-inclusive* of waters with a significant nexus to traditionally navigable waters. The Rule permits jurisdictional determinations on a case-specific basis for waters lying beyond the distance limitations used to

determine adjacency, and the science indicates that those waters within the distance limitations have a significant nexus to jurisdictional waters. Therefore, the Rule treats similar entities similarly—for example, the Rule treats a person seeking to develop a significantly-connected wetland 105 feet from a jurisdictional water in an identical manner to a person seeking to develop a significantly-connected wetland 95 feet from a jurisdictional water.

D. The Rule’s Distance Limitations Provide Valuable Clarity, Predictability, and Consistency.

The Agencies established numeric distance limitations to lend clarity, consistency, and predictability to the Rule, as requested by numerous commenters. Fed. Reg. 80 at 37057, 37090. It is well-established that courts value an agency’s decision to administer bright-line rules for these reasons. The District of Columbia Circuit has stated that bright-line rules enable regulated parties “to easily conform their conduct to the law and . . . enable [the agency] to take the rapid, decisive enforcement that is called for in the highly-charged political arena.” *Orloski v. FEC*, 795 F.2d 156, 165 (D.C. Cir. 1986). Case-by-case tests, by contrast, can inundate agencies with advisory opinion requests and force agencies to spend scarce resources on case-specific inquiries for every complaint, “even those involving the most mundane” issues. *Id.* See *Universal Studios LLLP v. Peters*, 308 F. Supp. 2d 1, 10 (D.C. Cir. 2004) (upholding Copyright Office’s bright-line rule requiring the Office to refuse to accept applications that arrive at the office

even one day past the filing deadline, citing “the need for clarity, predictability, and efficiency that [the Copyright Office’s] ‘bright line’ rule assures”).

The Rule’s distance limitations, like the rules at issue in *Orloski* and *Universal Studios*, provide clarity and predictability to the otherwise complicated science of hydrology because, under the Rule, citizens can use measurable distances to determine whether certain waters are *per se* jurisdictional. Moreover, the burden of issuing jurisdictional determinations—both on the Agencies and the citizens—will be significantly reduced if the Agencies set clear delineations instead of always using a case-by-case analysis to determine those clearly jurisdictional waters.

CONCLUSION

For the foregoing reasons, *Amici* respectfully request that this Court reach the merits and uphold the Clean Water Rule. If this Court holds the rule partially invalid, *Amici* respectfully request that the Court only strike down those portions of the Rule that it deems invalid. As a general rule, “[a] court would exceed its proper scope of review if it struck down the entirety of [a regulation], where only a part is invalid, and where the remaining portion may sensibly be given independent life.” *Stupak-Thrall v. United States*, 89 F.3d 1269, 1288-89 (6th Cir. 1996) (internal quotations omitted).

DATED: July 23, 2018
